PHP Callback Functions

[< Previous](#)[Next >](#)

PHP Callback Functions

A callback function is a function that is passed as an argument into another function.

A callback function can be:

- A named function - pass the function name as a string
- An anonymous function - define a function inline, and pass it as an argument

Use a Named Function as a Callback

Any existing function can be used as a callback function. To use a named function as a callback function, pass a string containing the name of the function as the argument of another function:

each number in an array:

[REMOVE ADS](#)

```
<?php
// Define the named callback function
function myfunction($n) {
    return($n * $n);
}

// Array of numbers to multiply
$numbers = [1, 2, 3, 4, 5];

// Use array_map with the myfunction function as a callback
print_r(array_map("myfunction", $numbers));
?>
```

needed.

Here we pass an anonymous function as a callback function:

Example

Use an anonymous function as a callback for PHP's [array_map\(\)](#) function:

```
<?php
$numbers = [1, 2, 3, 4, 5];
$res = array_map(function($n) {return($n * $n);}, $numbers);
print_r($res);
?>
```

PHP Callbacks in User Defined Functions

User-defined functions and methods can also take callback functions as arguments. To use callback functions inside a user-defined function or method, call it by adding parentheses to the variable and pass arguments as with normal functions:

Example

Run a callback from a user-defined function:

```
<?php
function exclaim($str) {
    return $str . "! ";
}

function ask($str) {
```

[Tutorials](#) ▼[References](#) ▼[Exercises](#) ▼[Get Certified](#)[CSS](#) [JAVASCRIPT](#) [SQL](#) [PYTHON](#) [JAVA](#) [PHP](#) [HOW TO](#) [W3.CSS](#) [C](#)

```
echo $format($str);  
}
```

```
// Pass "exclaim" and "ask" as callback functions to printFormatted()  
printFormatted("Hello world", "exclaim");  
printFormatted("Hello world", "ask");  
?>
```
